Title: Fc Online(Football game)

1. It was hard to take all the classes into the diagram since there are more than 9 classes I have thought of. In addition, it was hard to think of all the states and behaviours. Once again, there are a lot more states and behaviours when I think of this game.

2. I used AI tool to think about some specific states and behaviours.

3. AI tool does not provide all the required states and behaviours. It means that I must think about everything. At first, I thought it could be useful, but it did not help me that much. One advantage I could take was it gave me some good examples for me to think about what classes can be included in. AI tool gave me other examples, but it was useful.

4. When people make a program using java, they must think a lot more about

details of the classes, meaning how the program will be run and how mother classes and sub classes would be connected to. HW2 made me think more about how important to design the program before people actually do coding works.
